ABSTRACT

For a continuous and positive function $w(\lambda)$, $\lambda > 0$ and μ a positive measure on $(0, \infty)$ we consider the following *integral transform*

$$\mathcal{D}(w, \mu)(T) := \int_0^\infty w(\lambda) (\lambda + T)^{-1} d\mu(\lambda),$$

where the integral is assumed to exist for T a positive operator on a complex Hilbert space H .

We show among others that, if $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M , then

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] \\ &\leq \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] (B - A)^{-1} \\ &\leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &\leq \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)] (B - A)^{-1} \\ &\leq \frac{M^2}{m^2} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)]. \end{aligned}$$

Some examples for operator monotone and operator convex functions as well as for integral transforms $\mathcal{D}(\cdot, \cdot)$ related to the exponential and logarithmic functions are also provided.

RESUMEN

Para una función continua y positiva $w(\lambda)$, $\lambda > 0$ y μ una medida positiva sobre $(0, \infty)$ consideramos la siguiente *transformada integral*

$$\mathcal{D}(w, \mu)(T) := \int_0^\infty w(\lambda) (\lambda + T)^{-1} d\mu(\lambda),$$

donde se asume que la integral existe para un operador positivo T , sobre el espacio complejo de Hilbert H .

Mostramos, entre otras cosas, que si $\beta \geq A \geq \alpha > 0$, $B > 0$ con $M \geq B - A \geq m > 0$ para algunas constantes α , β , m , M , entonces

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] \\ &\leq \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] (B - A)^{-1} \\ &\leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &\leq \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)] (B - A)^{-1} \\ &\leq \frac{M^2}{m^2} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)]. \end{aligned}$$

También se proporcionan algunos ejemplos para las funciones operador monótono y operador convexo, así como de transformadas integrales $\mathcal{D}(\cdot, \cdot)$ relacionadas con las funciones exponencial y logarítmica.

Keywords and Phrases: Operator monotone functions, Operator convex functions, Operator inequalities, Löwner-Heinz inequality, Logarithmic operator inequalities.

1 Introduction

Consider a complex Hilbert space $(H, \langle \cdot, \cdot \rangle)$. An operator T is said to be positive (denoted by $T \geq 0$) if $\langle Tx, x \rangle \geq 0$ for all $x \in H$ and also an operator T is said to be *strictly positive* (denoted by $T > 0$) if T is positive and invertible. A real valued continuous function f on $(0, \infty)$ is said to be operator monotone if $f(A) \geq f(B)$ holds for any $A \geq B > 0$.

We have the following representation of operator monotone functions [6], see for instance [1, p. 144–145]:

Theorem 1.1. *A function $f : [0, \infty) \rightarrow \mathbb{R}$ is operator monotone in $[0, \infty)$ if and only if it has the representation*

$$f(t) = f(0) + bt + \int_0^\infty \frac{t\lambda}{t+\lambda} d\mu(\lambda), \quad (1.1)$$

where $b \geq 0$ and a positive measure μ on $[0, \infty)$ such that

$$\int_0^\infty \frac{\lambda}{1+\lambda} d\mu(\lambda) < \infty. \quad (1.2)$$

A real valued continuous function f on an interval I is said to be *operator convex* (*operator concave*) on I if

$$f((1-\lambda)A + \lambda B) \leq (\geq) (1-\lambda)f(A) + \lambda f(B) \quad (\text{OC})$$

in the operator order, for all $\lambda \in [0, 1]$ and for every selfadjoint operator A and B on a Hilbert space H whose spectra are contained in I . Notice that a function f is operator concave if $-f$ is operator convex. We have the following representation of operator convex functions [1, p. 147]:

Theorem 1.2. *A function $f : [0, \infty) \rightarrow \mathbb{R}$ is operator convex in $[0, \infty)$ with $f'_+(0) \in \mathbb{R}$ if and only if it has the representation*

$$f(t) = f(0) + f'_+(0)t + ct^2 + \int_0^\infty \frac{t^2\lambda}{t+\lambda} d\mu(\lambda), \quad (1.3)$$

where $c \geq 0$ and a positive measure μ on $[0, \infty)$ such that (1.2) holds.

We have the following integral representation for the power function when $t > 0$, $r \in (0, 1]$, see for instance [1, p. 145]

$$t^{r-1} = \frac{\sin(r\pi)}{\pi} \int_0^\infty \frac{\lambda^{r-1}}{\lambda+t} d\lambda. \quad (1.4)$$

Observe that for $t > 0$, $t \neq 1$, we have

$$\int_0^u \frac{d\lambda}{(\lambda+t)(\lambda+1)} = \frac{\ln t}{t-1} + \frac{1}{1-t} \ln \left(\frac{u+t}{u+1} \right), \quad \text{for all } u > 0$$

By taking the limit over $u \rightarrow \infty$ in this equality, we derive

$$\frac{\ln t}{t-1} = \int_0^\infty \frac{d\lambda}{(\lambda+t)(\lambda+1)},$$

which gives the representation for the logarithm

$$\ln t = (t - 1) \int_0^\infty \frac{d\lambda}{(\lambda + 1)(\lambda + t)}, \quad \text{for all } t > 0. \quad (1.5)$$

Motivated by these representations, we introduce, for a continuous and positive function $w(\lambda)$, $\lambda > 0$, the following *integral transform*

$$\mathcal{D}(w, \mu)(t) := \int_0^\infty \frac{w(\lambda)}{\lambda + t} d\mu(\lambda), \quad t > 0, \quad (1.6)$$

where μ is a positive measure on $(0, \infty)$ and the integral (1.6) exists for all $t > 0$. For μ the Lebesgue usual measure, we put

$$\mathcal{D}(w)(t) := \int_0^\infty \frac{w(\lambda)}{\lambda + t} d\lambda, \quad t > 0. \quad (1.7)$$

If we take μ to be the usual Lebesgue measure and the kernel $w_r(\lambda) = \lambda^{r-1}$, $r \in (0, 1]$, then

$$t^{r-1} = \frac{\sin(r\pi)}{\pi} \mathcal{D}(w_r)(t), \quad t > 0. \quad (1.8)$$

For the same measure, if we take the kernel $w_{\ln}(\lambda) = (\lambda + 1)^{-1}$, $t > 0$, we have the representation

$$\ln t = (t - 1) \mathcal{D}(w_{\ln})(t), \quad t > 0. \quad (1.9)$$

Assume that $T > 0$, then by the continuous functional calculus for selfadjoint operators, we can define the positive operator

$$\mathcal{D}(w, \mu)(T) := \int_0^\infty w(\lambda) (\lambda + T)^{-1} d\mu(\lambda), \quad (1.10)$$

where w and μ are as above. Also, when μ is the usual Lebesgue measure, then

$$\mathcal{D}(w)(T) := \int_0^\infty w(\lambda) (\lambda + T)^{-1} d\lambda, \quad \text{for } T > 0. \quad (1.11)$$

From (1.8) we have the representation

$$T^{r-1} = \frac{\sin(r\pi)}{\pi} \mathcal{D}(w_r)(T) \quad (1.12)$$

where $T > 0$ and from (1.9)

$$(T - 1)^{-1} \ln T = \mathcal{D}(w_{\ln})(T) \quad (1.13)$$

provided $T > 0$ and $T - 1$ is invertible.

In what follows, if A is an operator and a is a real number, then by $A \geq a$ we understand $A \geq aI$, where I is the identity operator.

In this paper we show among others that, if $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M , then

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] \\ &\leq \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] (B - A)^{-1} \\ &\leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &\leq \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)] (B - A)^{-1} \\ &\leq \frac{M^2}{m^2} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)]. \end{aligned}$$

Some examples for operator monotone and operator convex functions as well as for integral transforms $\mathcal{D}(\cdot, \cdot)$ related to the exponential and logarithmic functions are also provided.

2 Main results

In the following, whenever we write $\mathcal{D}(w, \mu)$ we mean that the integral from (1.6) exists and is finite for all $t > 0$.

Theorem 2.1. *For all $A, B > 0$ with $B - A \geq 0$ we have the representation*

$$\begin{aligned} 0 &\leq (B - A)^{1/2} [\mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B)] (B - A)^{1/2} \\ &= \int_0^\infty \left(\int_0^1 [(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2}]^2 ds \right) \times w(\lambda) d\mu(\lambda). \end{aligned} \quad (2.1)$$

Proof. Observe that, for all $A, B > 0$

$$\mathcal{D}(w, \mu)(B) - \mathcal{D}(w, \mu)(A) = \int_0^\infty w(\lambda) \left[(\lambda + B)^{-1} - (\lambda + A)^{-1} \right] d\mu(\lambda). \quad (2.2)$$

Let $T, S > 0$. The function $f(t) = -t^{-1}$ is operator monotone on $(0, \infty)$, operator Gâteaux differentiable and the Gâteaux derivative is given by

$$\nabla f_T(S) := \lim_{t \rightarrow 0} \left[\frac{f(T + tS) - f(T)}{t} \right] = T^{-1}ST^{-1}, \quad \text{for } T, S > 0 \quad (2.3)$$

Consider the continuous function f defined on an interval I for which the corresponding operator function is Gâteaux differentiable on the segment $[C, D] : \{(1 - t)C + tD, t \in [0, 1]\}$ for C, D selfadjoint operators with spectra in I . We consider the auxiliary function defined on $[0, 1]$ by

$$f_{C,D}(t) := f((1 - t)C + tD), \quad t \in [0, 1].$$

Then we have, by the properties of the Bochner integral, that

$$f(D) - f(C) = \int_0^1 \frac{d}{dt} (f_{C,D}(t)) dt = \int_0^1 \nabla f_{(1-t)C+tD}(D - C) dt. \quad (2.4)$$

If we write this equality for the function $f(t) = -t^{-1}$ and $C, D > 0$, then we get the representation

$$C^{-1} - D^{-1} = \int_0^1 ((1-t)C + tD)^{-1} (D - C) ((1-t)C + tD)^{-1} dt. \quad (2.5)$$

Now, if we take in (2.5) $C = \lambda + B$, $D = \lambda + A$, then

$$\begin{aligned} & (\lambda + B)^{-1} - (\lambda + A)^{-1} \\ &= \int_0^1 ((1-t)(\lambda + B) + t(\lambda + A))^{-1} (A - B) \times ((1-t)(\lambda + B) + t(\lambda + A))^{-1} dt \\ &= \int_0^1 (\lambda + (1-t)B + tA)^{-1} (A - B) (\lambda + (1-t)B + tA)^{-1} dt \end{aligned} \quad (2.6)$$

and by (2.2) we derive

$$\begin{aligned} & \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &= \int_0^\infty w(\lambda) \left(\int_0^1 (\lambda + (1-t)B + tA)^{-1} (B - A) \times (\lambda + (1-t)B + tA)^{-1} dt \right) d\mu(\lambda) \\ &= \int_0^\infty w(\lambda) \left(\int_0^1 (\lambda + sB + (1-s)A)^{-1} (B - A) \times (\lambda + sB + (1-s)A)^{-1} ds \right) d\mu(\lambda) \end{aligned} \quad (2.7)$$

for all $A, B > 0$, where for the last equality we used the change of variable $s = 1 - t$, $t \in [0, 1]$.

Now, since $B - A \geq 0$, hence by multiplying both sides with $(B - A)^{1/2}$ we get

$$\begin{aligned} & (B - A)^{1/2} [\mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B)] (B - A)^{1/2} \\ &= \int_0^\infty w(\lambda) \left(\int_0^1 (B - A)^{1/2} (\lambda + sB + (1-s)A)^{-1} (B - A) \right. \\ &\quad \times (\lambda + sB + (1-s)A)^{-1} (B - A)^{1/2} ds \Big) d\mu(\lambda) \\ &= \int_0^\infty w(\lambda) \left(\int_0^1 (B - A)^{1/2} (\lambda + sB + (1-s)A)^{-1} (B - A)^{1/2} \right. \\ &\quad \times (B - A)^{1/2} (\lambda + sB + (1-s)A)^{-1} (B - A)^{1/2} ds \Big) d\mu(\lambda) \\ &= \int_0^\infty w(\lambda) \times \left(\int_0^1 \left[(B - A)^{1/2} (\lambda + sB + (1-s)A)^{-1} (B - A)^{1/2} \right]^2 ds \right) d\mu(\lambda), \end{aligned} \quad (2.8)$$

which proves the identity in (2.1). Since

$$\left[(B - A)^{1/2} (\lambda + sB + (1-s)A)^{-1} (B - A)^{1/2} \right]^2 \geq 0$$

then by integrating over s on $[0, 1]$, multiplying by $w(\lambda) \geq 0$ and integrating over $d\mu(\lambda)$, we deduce the inequality in (2.1). $\square$

The case of operator monotone functions is as follows:

Corollary 2.2. *Assume that f is operator monotone on $[0, \infty)$, then all $A, B > 0$ with $B - A \geq 0$ we have the equality*

$$\begin{aligned} 0 &\leq (B - A)^{1/2} [f(A)A^{-1} - f(B)B^{-1}] (B - A)^{1/2} \\ &\quad - f(0)(B - A)^{1/2} (A^{-1} - B^{-1}) (B - A)^{1/2} \\ &= \int_0^\infty \left(\int_0^1 [(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2}]^2 ds \right) \lambda d\mu(\lambda) \end{aligned} \quad (2.9)$$

for some positive measure $\mu(\lambda)$. If $f(0) = 0$, then

$$\begin{aligned} 0 &\leq (B - A)^{1/2} [f(A)A^{-1} - f(B)B^{-1}] (B - A)^{1/2} \\ &= \int_0^\infty \left(\int_0^1 [(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2}]^2 ds \right) \times \lambda d\mu(\lambda). \end{aligned} \quad (2.10)$$

Proof. From (1.1) we have the representation

$$\frac{f(t) - f(0)}{t} - b = \mathcal{D}(\ell, \mu)(t), \quad (2.11)$$

with $\ell(\lambda) = \lambda$, for some positive measure $\mu(\lambda)$ and nonnegative number b . Since

$$\begin{aligned} \mathcal{D}(\ell, \mu)(A) - \mathcal{D}(\ell, \mu)(B) &= [f(A) - f(0)]A^{-1} - [f(B) - f(0)]B^{-1} \\ &= f(A)A^{-1} - f(B)B^{-1} - f(0)(A^{-1} - B^{-1}), \end{aligned}$$

hence by (2.1) we get (2.9). $\square$

The case of operator convex functions is as follows:

Corollary 2.3. *Assume that f is operator convex on $[0, \infty)$, then all $A, B > 0$ with $B - A \geq 0$ we have that*

$$\begin{aligned} 0 &\leq (B - A)^{1/2} [f(A)A^{-2} - f(B)B^{-2}] (B - A)^{1/2} \\ &\quad - f'_+(0)(B - A)^{1/2} (A^{-1} - B^{-1}) (B - A)^{1/2} \\ &\quad - f(0)(B - A)^{1/2} (A^{-2} - B^{-2}) (B - A)^{1/2} \\ &= \int_0^\infty \left(\int_0^1 [(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2}]^2 ds \right) \times \lambda d\mu(\lambda), \end{aligned} \quad (2.12)$$

for some positive measure $\mu(\lambda)$. If $f(0) = 0$, then

$$\begin{aligned} 0 &\leq (B - A)^{1/2} [f(A)A^{-2} - f(B)B^{-2}] (B - A)^{1/2} \\ &\quad - f'_+(0)(B - A)^{1/2} (A^{-1} - B^{-1}) (B - A)^{1/2} \\ &= \int_0^\infty \left(\int_0^1 [(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2}]^2 ds \right) \times \lambda d\mu(\lambda). \end{aligned} \quad (2.13)$$

Proof. From (1.3) we have that

$$\frac{f(t) - f(0) - f'_+(0)t}{t^2} - c = \mathcal{D}(\ell, \mu)(t),$$

for $t > 0$. Then for $A, B > 0$,

$$\begin{aligned} \mathcal{D}(\ell, \mu)(A) - \mathcal{D}(\ell, \mu)(B) &= f(A)A^{-2} - f'_+(0)A^{-1} - f(0)A^{-2} - f(A)B^{-2} + f'_+(0)B^{-1} + f(0)B^{-2} \\ &= f(A)A^{-2} - f(B)B^{-2} - f'_+(0)(A^{-1} - B^{-1}) - f(0)(A^{-2} - B^{-2}) \end{aligned}$$

and by (2.1) we derive (2.13). $\square$

When more conditions are imposed on the operators A and B we have the following refinements and reverses of the inequality

$$0 \leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B)$$

that hold for $B - A \geq 0$.

Theorem 2.4. *If $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M , then*

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] \\ &\leq \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)] (B - A)^{-1} \\ &\leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &\leq \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)] (B - A)^{-1} \\ &\leq \frac{M^2}{m^2} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)]. \end{aligned} \tag{2.14}$$

Proof. For $s \in [0, 1]$ we have

$$\lambda + sB + (1 - s)A = \lambda + s(B - A) + A.$$

We have

$$\lambda + s(B - A) + A \geq \lambda + sm + A \geq \lambda + sm + \alpha = \lambda + (1 - s)\alpha + s(m + \alpha),$$

$s \in [0, 1]$ and $\lambda \geq 0$, which implies that

$$(\lambda + sB + (1 - s)A)^{-1} \leq [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-1}$$

and, by multiplying both sides by $(B - A)^{1/2} \geq 0$,

$$\begin{aligned} (B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} &\leq [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-1} (B - A) \\ &\leq M [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-1}. \end{aligned}$$

Furthermore,

$$\left[(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} \right]^2 \leq M^2 [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-2},$$

for $s \in [0, 1]$ and $\lambda \geq 0$, which implies by integration that

$$\begin{aligned} & \int_0^\infty w(\lambda) \left(\int_0^1 \left[(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} \right]^2 ds \right) d\mu(\lambda) \\ & \leq M^2 \int_0^\infty w(\lambda) \left(\int_0^1 [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-2} ds \right) d\mu(\lambda) \\ & = \frac{M^2}{m} \int_0^\infty w(\lambda) \left(\int_0^1 [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-1} (m + \alpha - \alpha) \right. \\ & \quad \left. \times [\lambda + (1 - s)\alpha + s(m + \alpha)]^{-1} ds \right) d\mu(\lambda) \quad (\text{and by (2.7)}) \\ & = \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)]. \end{aligned}$$

Using (2.8) we get

$$(B - A)^{1/2} [\mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B)] (B - A)^{1/2} \leq \frac{M^2}{m} [\mathcal{D}(w, \mu)(\alpha) - \mathcal{D}(w, \mu)(m + \alpha)].$$

Multiplying both sides with $(B - A)^{-1/2}$ we deduce the fourth inequality in (2.14). We also have

$$\lambda + s(B - A) + A \leq \lambda + sM + A \leq \lambda + sM + \beta = \lambda + (1 - s)\beta + s(M + \beta),$$

which implies that

$$(\lambda + sB + (1 - s)A)^{-1} \geq [\lambda + (1 - s)\beta + s(M + \beta)]^{-1}$$

and, by multiplying both sides by $(B - A)^{1/2} \geq 0$,

$$\begin{aligned} (B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} & \geq [\lambda + (1 - s)\beta + s(M + \beta)]^{-1} (B - A) \\ & \geq m [\lambda + (1 - s)\beta + s(M + \beta)]^{-1}, \end{aligned}$$

for $s \in [0, 1]$ and $\lambda \geq 0$. By taking the square, we get

$$\left[(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} \right]^2 \geq m^2 [\lambda + (1 - s)\beta + s(M + \beta)]^{-2},$$

for $s \in [0, 1]$ and $\lambda \geq 0$. By taking the integrals in this inequality we obtain

$$\begin{aligned} & \int_0^\infty w(\lambda) \left(\int_0^1 \left[(B - A)^{1/2} (\lambda + sB + (1 - s)A)^{-1} (B - A)^{1/2} \right]^2 ds \right) d\mu(\lambda) \\ & \geq m^2 \int_0^\infty w(\lambda) \left(\int_0^1 [\lambda + (1 - s)\beta + s(M + \beta)]^{-2} ds \right) d\mu(\lambda) \\ & = \frac{m^2}{M} \int_0^\infty w(\lambda) \left(\int_0^1 [\lambda + (1 - s)\beta + s(M + \beta)]^{-1} (M + \beta - \beta) \right. \\ & \quad \left. \times [\lambda + (1 - s)\beta + s(M + \beta)]^{-1} ds \right) d\mu(\lambda) \quad (\text{and by (2.7)}) \\ & = \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)]. \end{aligned}$$

Using (2.8) we get

$$(B - A)^{1/2} [\mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B)] (B - A)^{1/2} \geq \frac{m^2}{M} [\mathcal{D}(w, \mu)(\beta) - \mathcal{D}(w, \mu)(M + \beta)].$$

Multiplying both sides with $(B - A)^{-1/2}$ we deduce the second inequality in (2.14). The rest of the inequalities are obvious. $\square$

It is well known that, if $P \geq 0$, then

$$|\langle Px, y \rangle|^2 \leq \langle Px, x \rangle \langle Py, y \rangle,$$

for all $x, y \in H$. Therefore, if $T > 0$, then

$$0 \leq \langle x, x \rangle^2 = \langle T^{-1}Tx, x \rangle^2 = \langle Tx, T^{-1}x \rangle^2 \leq \langle Tx, x \rangle \langle TT^{-1}x, T^{-1}x \rangle = \langle Tx, x \rangle \langle x, T^{-1}x \rangle,$$

for all $x \in H$. If $x \in H$, $\|x\| = 1$, then

$$1 \leq \langle Tx, x \rangle \langle x, T^{-1}x \rangle \leq \langle Tx, x \rangle \sup_{\|x\|=1} \langle x, T^{-1}x \rangle = \langle Tx, x \rangle \|T^{-1}\|,$$

which implies the following operator inequality

$$\|T^{-1}\|^{-1} \leq T. \quad (2.15)$$

Remark 2.5. If $A > 0$ and $B - A > 0$, then obviously $\|A\| \geq A \geq \|A^{-1}\|^{-1}$ and $\|B - A\| \geq B - A \geq \|(B - A)^{-1}\|^{-1}$. So, if we take $\beta = \|A\|$, $\alpha = \|A^{-1}\|^{-1}$, $M = \|B - A\|$ and $m = \|(B - A)^{-1}\|^{-1}$ in (2.14), then we get

$$\begin{aligned} 0 &\leq \frac{\mathcal{D}(w, \mu)(\|A\|) - \mathcal{D}(w, \mu)(\|B - A\| + \|A\|)}{\|B - A\|^2 \|(B - A)^{-1}\|^2} \\ &\leq \frac{\mathcal{D}(w, \mu)(\|A\|) - \mathcal{D}(w, \mu)(\|B - A\| + \|A\|)}{\|B - A\| \|(B - A)^{-1}\|^2} (B - A)^{-1} \\ &\leq \mathcal{D}(w, \mu)(A) - \mathcal{D}(w, \mu)(B) \\ &\leq \|B - A\|^2 \|(B - A)^{-1}\| \\ &\times \left[\mathcal{D}(w, \mu)(\|A^{-1}\|^{-1}) - \mathcal{D}(w, \mu)(\|(B - A)^{-1}\|^{-1} + \|A^{-1}\|^{-1}) \right] \times (B - A)^{-1} \\ &\leq \|B - A\|^2 \|(B - A)^{-1}\|^2 \\ &\times \left[\mathcal{D}(w, \mu)(\|A^{-1}\|^{-1}) - \mathcal{D}(w, \mu)(\|(B - A)^{-1}\|^{-1} + \|A^{-1}\|^{-1}) \right]. \end{aligned} \quad (2.16)$$

Corollary 2.6. Assume that f is operator monotone on $[0, \infty)$. If $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M , then

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} \left[\frac{f(\beta)}{\beta} - \frac{f(M+\beta)}{M+\beta} - \frac{M}{\beta(M+\beta)} f(0) \right] \\ &\leq \frac{m^2}{M} \left[\frac{f(\beta)}{\beta} - \frac{f(M+\beta)}{M+\beta} - \frac{M}{\beta(M+\beta)} f(0) \right] (B-A)^{-1} \\ &\leq f(A) A^{-1} - f(B) B^{-1} - f(0) (A^{-1} - B^{-1}) \\ &\leq \frac{M^2}{m} \left[\frac{f(\alpha)}{\alpha} - \frac{f(m+\alpha)}{m+\alpha} - \frac{m}{\alpha(m+\alpha)} f(0) \right] (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} \left[\frac{f(\alpha)}{\alpha} - \frac{f(m+\alpha)}{m+\alpha} - \frac{m}{\alpha(m+\alpha)} f(0) \right]. \end{aligned} \quad (2.17)$$

If $f(0) = 0$, then

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} \left[\frac{f(\beta)}{\beta} - \frac{f(M+\beta)}{M+\beta} \right] \leq \frac{m^2}{M} \left[\frac{f(\beta)}{\beta} - \frac{f(M+\beta)}{M+\beta} \right] (B-A)^{-1} \\ &\leq f(A) A^{-1} - f(B) B^{-1} \leq \frac{M^2}{m} \left[\frac{f(\alpha)}{\alpha} - \frac{f(m+\alpha)}{m+\alpha} \right] (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} \left[\frac{f(\alpha)}{\alpha} - \frac{f(m+\alpha)}{m+\alpha} \right]. \end{aligned} \quad (2.18)$$

The proof follows by (2.14) and the representation (2.11).

Remark 2.7. If $A > 0$ and $B - A > 0$, then for f an operator monotone function on $[0, \infty)$ with $f(0) = 0$, we obtain from (2.18) some similar inequalities to the ones in Remark 2.5. We omit the details.

The case of operator convex functions is as follows:

Corollary 2.8. Assume that f is operator convex on $[0, \infty)$. If $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M , then

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} \left[\frac{f(\beta)}{\beta^2} - \frac{f(M+\beta)}{(M+\beta)^2} - f'_+(0) \frac{M}{\beta(M+\beta)} - f(0) \frac{M(M+2\beta)}{\beta^2(M+\beta)^2} \right] \\ &\leq \frac{m^2}{M} \left[\frac{f(\beta)}{\beta^2} - \frac{f(M+\beta)}{(M+\beta)^2} - f'_+(0) \frac{M}{\beta(M+\beta)} - f(0) \frac{M(M+2\beta)}{\beta^2(M+\beta)^2} \right] \times (B-A)^{-1} \\ &\leq f(A) A^{-2} - f(B) B^{-2} - f'_+(0) (A^{-1} - B^{-1}) - f(0) (A^{-2} - B^{-2}) \\ &\leq \frac{M^2}{m} \left[\frac{f(\alpha)}{\alpha^2} - \frac{f(m+\alpha)}{(m+\alpha)^2} - f'_+(0) \frac{m}{\alpha(m+\alpha)} - f(0) \frac{m(m+2\alpha)}{\alpha^2(m+\alpha)^2} \right] \times (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} \left[\frac{f(\alpha)}{\alpha^2} - \frac{f(m+\alpha)}{(m+\alpha)^2} - f'_+(0) \frac{m}{\alpha(m+\alpha)} - f(0) \frac{m(m+2\alpha)}{\alpha^2(m+\alpha)^2} \right]. \end{aligned} \quad (2.19)$$

If $f(0) = 0$, then

$$\begin{aligned}
 0 &\leq \frac{m^2}{M^2} \left[\frac{f(\beta)}{\beta^2} - \frac{f(M+\beta)}{(M+\beta)^2} - f'_+(0) \frac{M}{\beta(M+\beta)} \right] \\
 &\leq \frac{m^2}{M} \left[\frac{f(\beta)}{\beta^2} - \frac{f(M+\beta)}{(M+\beta)^2} - f'_+(0) \frac{M}{\beta(M+\beta)} \right] (B-A)^{-1} \\
 &\leq f(A) A^{-2} - f(B) B^{-2} - f'_+(0) (A^{-1} - B^{-1}) \\
 &\leq \frac{M^2}{m} \left[\frac{f(\alpha)}{\alpha^2} - \frac{f(m+\alpha)}{(m+\alpha)^2} - f'_+(0) \frac{m}{\alpha(m+\alpha)} \right] (B-A)^{-1} \\
 &\leq \frac{M^2}{m^2} \left[\frac{f(\alpha)}{\alpha^2} - \frac{f(m+\alpha)}{(m+\alpha)^2} - f'_+(0) \frac{m}{\alpha(m+\alpha)} \right].
 \end{aligned} \tag{2.20}$$

Remark 2.9. If $A > 0$ and $B - A > 0$, then for f an operator convex function on $[0, \infty)$ with $f(0) = 0$, we obtain from (2.20) some similar inequalities to the ones in Remark 2.5. We omit the details.

3 Some examples

The function $f(t) = t^r$, $r \in (0, 1]$ is operator monotone on $[0, \infty)$ and by (2.18) we obtain the power inequalities

$$\begin{aligned}
 0 &\leq \frac{m^2}{M^2} \left[\beta^{r-1} - (M+\beta)^{r-1} \right] \leq \frac{m^2}{M} \left[\beta^{r-1} - (M+\beta)^{r-1} \right] (B-A)^{-1} \\
 &\leq A^{r-1} - B^{r-1} \leq \frac{M^2}{m} \left[\alpha^{r-1} - (m+\alpha)^{r-1} \right] (B-A)^{-1} \\
 &\leq \frac{M^2}{m^2} \left[\alpha^{r-1} - (m+\alpha)^{r-1} \right],
 \end{aligned} \tag{3.1}$$

provided that $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M .

The function $f(t) = \ln(t+1)$ is operator monotone on $[0, \infty)$ and by (2.18) we get

$$\begin{aligned}
 0 &\leq \frac{m^2}{M^2} \left[\frac{\ln(\beta+1)}{\beta} - \frac{\ln(M+\beta+1)}{M+\beta} \right] \leq \frac{m^2}{M} \left[\frac{\ln(\beta+1)}{\beta} - \frac{\ln(M+\beta+1)}{M+\beta} \right] (B-A)^{-1} \\
 &\leq A^{-1} \ln(A+1) - B^{-1} \ln(B+1) \leq \frac{M^2}{m} \left[\frac{\ln(\alpha+1)}{\alpha} - \frac{\ln(m+\alpha+1)}{m+\alpha} \right] (B-A)^{-1} \\
 &\leq \frac{M^2}{m^2} \left[\frac{\ln(\alpha+1)}{\alpha} - \frac{\ln(m+\alpha+1)}{m+\alpha} \right],
 \end{aligned} \tag{3.2}$$

provided that $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M .

The function $f(t) = -\ln(t+1)$ is operator convex, and by (2.20) we obtain

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} \left[\frac{\ln(M+\beta+1)}{(M+\beta)^2} - \frac{\ln(\beta+1)}{\beta^2} + \frac{M}{\beta(M+\beta)} \right] \\ &\leq \frac{m^2}{M} \left[\frac{\ln(M+\beta+1)}{(M+\beta)^2} - \frac{\ln(\beta+1)}{\beta^2} + \frac{M}{\beta(M+\beta)} \right] (B-A)^{-1} \\ &\leq B^{-2} \ln(B+1) - A^{-2} \ln(A+1) + A^{-1} - B^{-1} \\ &\leq \frac{M^2}{m} \left[\frac{\ln(m+\alpha+1)}{(m+\alpha)^2} - \frac{\ln(\alpha+1)}{\alpha^2} + \frac{m}{\alpha(m+\alpha)} \right] (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} \left[\frac{\ln(m+\alpha+1)}{(m+\alpha)^2} - \frac{\ln(\alpha+1)}{\alpha^2} + \frac{m}{\alpha(m+\alpha)} \right], \end{aligned} \quad (3.3)$$

provided that $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M .

Consider the kernel $e_{-a}(\lambda) := \exp(-a\lambda)$, $\lambda \geq 0$ and $a > 0$. Then

$$D(e_{-a})(t) := \int_0^\infty \frac{\exp(-a\lambda)}{t+\lambda} d\lambda = E_1(at) \exp(at), \quad t \geq 0,$$

where

$$E_1(t) := \int_t^\infty \frac{e^{-u}}{u} du, \quad t \geq 0. \quad (3.4)$$

For $a = 1$ we have

$$D(e_{-1})(t) := \int_0^\infty \frac{\exp(-\lambda)}{t+\lambda} d\lambda = E_1(t) \exp(t), \quad t \geq 0.$$

Let $\beta \geq A \geq \alpha > 0$, $B > 0$ with $M \geq B - A \geq m > 0$ for some constants α, β, m, M . Then by (2.14) we have

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [E_1(a\beta) \exp(a\beta) - E_1(a(M+\beta)) \exp(a(M+\beta))] \\ &\leq \frac{m^2}{M} [E_1(a\beta) \exp(a\beta) - E_1(a(M+\beta)) \exp(a(M+\beta))] (B-A)^{-1} \\ &\leq E_1(aA) \exp(aA) - E_1(aB) \exp(aB) \\ &\leq \frac{M^2}{m} [E_1(a\alpha) \exp(a\alpha) - E_1(a(m+\alpha)) \exp(a(m+\alpha))] (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} [E_1(a\alpha) \exp(a\alpha) - E_1(a(m+\alpha)) \exp(a(m+\alpha))], \end{aligned} \quad (3.5)$$

for $a > 0$. For $a = 1$ we have

$$\begin{aligned} 0 &\leq \frac{m^2}{M^2} [E_1(\beta) \exp(\beta) - E_1(M+\beta) \exp(M+\beta)] \\ &\leq \frac{m^2}{M} [E_1(\beta) \exp(\beta) - E_1(M+\beta) \exp(M+\beta)] (B-A)^{-1} \\ &\leq E_1(A) \exp(A) - E_1(B) \exp(B) \\ &\leq \frac{M^2}{m} [E_1(\alpha) \exp(\alpha) - E_1(m+\alpha) \exp(m+\alpha)] (B-A)^{-1} \\ &\leq \frac{M^2}{m^2} [E_1(\alpha) \exp(\alpha) - E_1(m+\alpha) \exp(m+\alpha)]. \end{aligned} \quad (3.6)$$

More examples of such transforms are

$$D(w_{1/(\ell^2+a^2)})(t) := \int_0^\infty \frac{1}{(t+\lambda)(\lambda^2+a^2)} d\lambda = \frac{\pi t - 2a \ln(t/a)}{2a(t^2+a^2)}, \quad t \geq 0$$

and

$$D(w_{\ell/(\ell^2+a^2)})(t) := \int_0^\infty \frac{\lambda}{(t+\lambda)(\lambda^2+a^2)} d\lambda = \frac{\pi a + 2t \ln(t/a)}{2a(t^2+a^2)}, \quad t \geq 0,$$

for $a > 0$. The interested reader may state other similar results by employing the examples of monotone operator functions provided in [2, 3, 4, 7] and [8].
